What is the Problem?

Small screen size is a problem in mobile Web access...

When is screen size really a problem?

- **text data** (e.g., latest news)
 - **sequential data** → you can read by sequential scrolling
 - **2-dimensional page layout** is the problem
- **maps, images**
 - inherently **2-dimensional** data
 - one of the most difficult data types on small screens
- **tables**
 - also **2-dimensional**
 - also one of the most difficult types on small screens

携帯電話で商品情報が今すぐわかります。パッケージのQRコードで今すぐチェック!!

マクドナルドでは、QRコードを印刷した新パッケージを導入しています。商品のパッケージについているQRコードから携帯電話でアクセスいただくと、エネルギーや栄養系・アレルギー物質の情報が食べてているその場で簡単にご確認いただけます。また「栄養バランスチェック」ではマクドナルドの商品が1日に必要な栄養摂取量の内、どれだけ補えるかを年齢別にチェックできます。ぜひ一度お試しください。

■ QRコードの使い方。

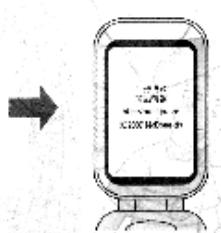

step1

QRコード対応の携帯電話でQRコードを読み取るか、書かれているURLへアクセス。

step2

QRコード読み取った場合、表示されたURLをクリック。

step3

読みたい商品の商品情報が表示されます。ニカルコード4つの栄養素、商品情報が掲載されています。より詳しく情報を知りたいときは、「栄養情報詳細」「アレルギー情報」をクリック。

■ 例えはこんなときに、QRコード活用法。

case1

エネルギー4つの栄養素が掲載されています。栄養表より詳しく知りたいときは、「栄養情報詳細」をクリックするなどご覧ください。

case2

「商品情報」からリンクしている「栄養バランスチェック」では、あなたに必要な1日の栄養の内、マクドナルドの商品がどれだけ補えるか算出させてチェックすることができます。

case3

アレルギー情報は「商品から」アレルギー物質から検索可能になります。また、お店へ行くほど興味がないときは、URLを登録しておくと、全ての商品を検索することができます。

What is the Problem?

Do we access tables from mobile phones so often?

↓
Yes

- train timetables
- movie schedules
- stock markets
- :
- Many Web sites shows **search results** in tables.

Tables are important in mobile Web access.

Goal of this Research

Tables are:

- frequently accessed in mobile Web access while
- especially difficult to browse on small screens

We develop interaction techniques for browsing HTML tables on small screens.

Basic Structure of Tables

Item	Cal	Sugar	Fat	...	Milk	Wheat	Egg
Hamburger	100	5.5	9	...	-	✓	✓
Cheeseburger	200	6.5	12	...	✓	✓	✓
Potato(S)	230	0.0	11	...	-	✓	-
Potato(M)	380	0.0	19	...			
:	:	:	:	:	:	:	:
Gigaburger	540	8.8	29	...	-	✓	✓

- concisely represent two contexts of each cell by its horizontal and vertical positions.
- “cal of Hamburger is 100, sugar of Hamburger is 5.5, ..., cal of Cheeseburger is 200, ...”

Basic Structure of Tables

Item	Cal	Sugar	Fat	...	Milk	Wheat	Egg
Hamburger	250	5.5	9	...	-	✓	✓
Cheeseburger	300	6.5	12	...	✓	✓	✓
Potato(S)	230	0.0	11	...	-	✓	-
Potato(M)	380	0.0	19	...			
:	:	:	:	:	:	:	:
Gigaburger	540	8.8	29	...	-	✓	✓

attribute names: describe types of values in each column

Basic Structure of Tables

Item	Cal	Sugar	Fat	...	Milk	Wheat	Egg
Hamburger	250	5.5	9	...	-	✓	✓
Cheeseburger	300	6.5	12	...	✓	✓	✓
Potato(S)	230	0.0	11	...	-	✓	-
Potato(M)	380	0.0	19	...			
:	:	:	:	:	:	:	:
Gigaburger	540	8.8	29	...	-	✓	✓

attribute names: describe types of values in each column
key values: have unique values that briefly explain the meaning of each row

We call them headers.

Browsing Modes

We provide three browsing modes.

1. Normal Mode (default):

- ordinary representation + various useful functions

2. Record Mode:

- Show each row/column in a record-like format
- When we randomly move around, **we may get lost.**

3. Cell Mode:

- Show each cell together with its row/column headers, so **we never get lost.**

DEMO

Typical Tasks and Corresponding Operations

Read a cell at the intersection of a given row & column

⇒ **record mode or cell mode**

Read cells in a given row (or column)

⇒ **record mode or cell mode**

Read tables row by row (or column by column)

⇒ **record mode or cell mode**

Randomly move and read cells at various positions

⇒ **cell mode**

Compare two (or more) given rows (or columns)

⇒ **hiding unnecessary rows/columns in normal mode**

Find where in the table a given value appears

⇒ **intra-page search and click the cell to see its headers in normal mode**

Technical Issues

We need to detect logical structure in tables.

1. Which cells are row/column headers?
(attribute names or key values)
2. Semantics of composite cells?
 - In normal mode:
We need to know hierarchical attributes.
 - In record/cell mode:
We decompose composite cells in accordance with their semantics.

Semantics of Composite Cells

Neighbors Sharing Same Values

Item	Cal	Sugar	Fat	...	Allergen		
					Milk	Wheat	...
Hamburger	150	2.5	5.8	...	-	-	...
Cheeseburger	160	2.5	6.0	...	-	-	...
Potato(S)	160	2.5	6.0	...	-		...
Potato(M)	250	3.8	9.1	...		✓	...
:	:	:	:	:	:	:	:
Gigaburger	280	4.3	13.0	...	-	-	...

Automatic Detection of Logical Structure

Overview

We use:

- structure of composite cells
 - to detect **attribute names**
 - to detect **semantics of composite cells**
- uniqueness of values
 - to detect **attribute names**
 - to detect **keys**

Automatic Detection of Logical Structure

Step1: Attribute Detection Based on Composite Cells

- We defined **valid table structure** by a set of rules.
- We search the attribute/body border satisfying them.

	category	weight	max	min
mail	type 2	card double postal	2g to 6g 4g to 12g	
	type 1	regular	up to 50g	
		irregular	up to 4kg	
	type 3		up to 1kg	
	type 4		up to 1kg up to 3kg	
	normal/braille book parcel for handicapped		up to 30kg up to 3kg	
parcel				

Automatic Detection of Logical Structure

Step2: Attribute/Key Detection by Value Uniqueness

- We find a set of columns/rows that gives unique values.
- We give priority to those closer to top/left edge.

	year	first name	last name	age
★	freshman	David	Adams	18
★	freshman	David	Jones	19
★	sophomore	Mary	Adams	19
:	:	:	:	:

Automatic Detection of Logical Structure

Step3: Semantics of Composite Cells

- **cells spanning the entire row/column**
→ captions etc.
- **composite cells in the attributes**
→ structured attributes
- **composite cells in the body without corresponding partitions in the header**
→ nested tables
- **the others**
→ merged cells

Experiment

- We collected 80 tables, and our method can detect correct headers for 76 of them (95%).
- Our method fails when:
 - headers appear only at the bottom or only at the right edge
 - tables have some illogical structure
 - it has some types of nested tables

Future Work

- 1. Evaluation of the proposed browsing modes**
 - Can users complete the task in shorter time?
 - Detected attributes/keys really help users?
 - Do we need record mode?
- 2. detection of logical tables described by <div> tags (e.g., Google)**
- 3. Improvement of automatic detection methods**

and more...
